

Which came first, the chicken or the egg?

Answer 1: The rooster

Answer 2: The egg came before the chicken

Defintions:

1) An egg is, as per Merriam-Webster: "a hard-shelled oval thing from which a young bird is born; also : an oval or round thing from which a snake, frog, insect, etc., is born."

2) A chicken is, as per Merriam-Webster: "the common domestic fowl (Gallus gallus) especially when young."

Axioms:

1) The theory of evolution holds true

2) The theory of creationism and other theories of similar nature do not hold true

Proof:

Using axioms 1 and 2, then chickens could not have come into existence instaneously, and instead follow the path of evolution.

Given the theory of evolution, the chicken evolved from a species of birds/dinosaurs, both of which relied on eggs as the method of birth

Therefore, the species that mutated into a chicken produced an egg which contained a chicken

Thus, the egg came before the chicken
